CE 874 - Secure Software Systems

Secure Architecture III

Mehdi Kharrazi
Department of Computer Engineering
Sharif University of Technology

Acknowledgments: Some of the slides are fully or partially obtained from other sources. A reference is noted on the bottom of each slide, when the content is fully obtained from another source. Otherwise a full list of references is provided on the last slide.
Secure Architecture

• How to come up with a secure architecture?
• What design principals is should be followed?
• What are the available mechanisms?
• How do you trust the code getting executed?

Will I regret having done this?
What will this machine compute?
What will this machine compute?
What will this machine compute?

\[ X_{Alice} \rightarrow F \]
What will this machine compute?

\[ X_{\text{Other}} \rightarrow F \rightarrow X_{\text{Alice}} \]
What will the machine compute?

\[ F(X_{\text{Other}}, X_{\text{Alice}}, Y_{\text{Alice}}) \]
What will this machine compute?

\[ F(X_{\text{Other}}, X_{\text{Alice}}, Y_{\text{Other}}, Y_{\text{Alice}}) \]
Does program $P$ compute $F$?

What will this machine compute?

Does program $P$ compute $F$?

$X_{\text{Other}} \rightarrow F \rightarrow Y_{\text{Other}}$

$X_{\text{Alice}} \rightarrow F \rightarrow Y_{\text{Alice}}$
Does program $P$ compute $F$?
Is $F$ what the programmer intended?

\[ \begin{align*}
X_{\text{Other}} & \rightarrow F \\
F & \rightarrow Y_{\text{Other}} \\
X_{\text{Alice}} & \rightarrow F \\
F & \rightarrow Y_{\text{Alice}} 
\end{align*} \]
Does program P compute F?
Is F what the programmer intended?

Bootstrapping Trust

What F will this machine compute?
Bootstrapping Trust is *Hard*!
Bootstrapping Trust is *Hard*!

- Challenges:
  - Hardware assurance

1) Establish Trust in Hardware
1) Establish Trust in Hardware

- Hardware is durable
1) Establish Trust in Hardware

- Hardware is durable
- Establish trust via:
  - Trust in the manufacturer
  - Physical security
1) Establish Trust in Hardware

- Hardware is durable

Open Question: Can we do better?
2) Establish Trust in Software
2) Establish Trust in Software

- Software is ephemeral

[Diagram showing App 1, ..., App N over OS]

[Parno’10]
2) Establish Trust in Software

- Software is ephemeral
- We care about the software currently in control

[Parno’10]
2) Establish Trust in Software

• Software is ephemeral
• We care about the software currently in control
• Many properties matter:
  • Proper control flow
  • Type safety
  • Correct information flow

...
2) Establish Trust in Software

- Software is ephemeral
- We care about the software currently in control
- Many properties matter:
  - Proper control flow
  - Type safety
  - Correct information flow

Which property matters most?

[Parno’10]
A Simple Thought Experiment
A Simple Thought Experiment

- Imagine a perfect algorithm for analyzing control flow
  - Guarantees a program always follows intended control flow
A Simple Thought Experiment

- Imagine a perfect algorithm for analyzing control flow
  - Guarantees a program always follows intended control flow
- Does this suffice to bootstrap trust?
A Simple Thought Experiment

• Imagine a perfect algorithm for analyzing control flow
  • Guarantees a program always follows intended control flow
• Does this suffice to bootstrap trust? \textbf{No!}
A Simple Thought Experiment

• Imagine a perfect algorithm for analyzing control flow
  • Guarantees a program always follows intended control flow

  • Program libraries
  • Program configuration files
  • Initial inputs
What is Code Identity?

• An attempt to capture the behavior of a program
• Current state of the art is the collection of:
  • Program binary
  • Program libraries
  • Program configuration files
  • Initial inputs

Function $f$
What is Code Identity?

- An attempt to capture the behavior of a program
- Current state of the art is the collection of:
  - Program binary
  - Program libraries
  - Program configuration files
  - Initial inputs

Function $f$  
Inputs to $f$
What is Code Identity?

- An attempt to capture the behavior of a program
- Current state of the art is the collection of:
  - Program binary
  - Program libraries
  - Program configuration files
  - Initial inputs
- Often condensed into a hash of the above

\[ f \]

\[ \text{Inputs to } f \]
Code Identity as Trust Foundation
Code Identity as Trust Foundation

• From code identity, you may be able to infer:
  • Proper control flow
  • Type safety
  • Correct information flow
  ...

[Parno’10]
Code Identity as Trust Foundation

• From code identity, you may be able to infer:
  • Proper control flow
  • Type safety
  • Correct information flow
  ...

• Reverse is not true!
What Can Code Identity Do For You?
What Can Code Identity Do For You?

- Research applications
  - Secure the boot process
  - Count-limit objects
  - Improve security of network protocols
- Thwart insider attacks
  - Protect passwords
  - Create a Trusted Third Party

A Bad Dream: Subverting Trusted Platform Module While You Are Sleeping, Seunghun Han, Wook Shin, Jun-Hyeok Park, and HyoungChun Kim, Usenix Security 2018
Trusted Computing Group (TCG)

- Defines global industry specifications and standards
- Is supportive of a hardware root of trust
  - Trusted Platform Module (TPM) is the core technology
  - TCG technology has been applied to Unified Extensible Firmware Interface (UEFI)
Trusted Platform Module (TPM) (1)

- Is a tamper-resistant device
- Has own processor, RAM, ROM, and non-volatile RAM
  - It has own state separated from the system
- Provides cryptographic and accumulating measurements functions
  - Measurement values are accumulated to Platform Configuration Registers (PCR #0~#23)
Trusted Platform Module (TPM) (2)

- Is used to determine the trustworthiness of a system by investigating the values stored in PCRs
  - A local verification or remote attestation can be used
- Is used to limit access to secret data based on specific PCR values
  - “Seal” operation encrypts secret data with the PCRs of the TPM
  - “Unseal” operation can decrypt the sealed data only if the PCR values match the specific values

[Han’18]
Root of Trust for Measurement (RTM)

- Sends integrity-relevant information (measurements) to the TPM
  - TPM accumulates the measurements to a PCR with the previously stored value in the PCR
    - **Extend:** \( \text{PCR}_{\text{new}} = \text{Hash}(\text{PCR}_{\text{old}} \ || \ \text{Measurement}_{\text{new}}) \)
- The CPU controlled by Core RTM (CRTM)
  - The CRTM is the first set of instructions when a new chain of trust is established
Static and Dynamic RTM (SRTM and DRTM)

- SRTM is started by static CRTM (S-CRTM) when the host platform starts at POWER-ON or RESTART

- DRTM is started by dynamic CRTM (D-CRTM) at runtime WITHOUT platform RESET

- They extend measurements (hashes) of components to PCRs BEFORE passing control to them
Static Root of Trust for Measurement

- BIOS/UEFI firmware
- S-CRTM
- BIOS/UEFI Code
- Bootloader
- Kernel
- User Applications
- TPM

- Power On/Restart

(Dashed lines: Extend a hash of next code to TPM. Solid lines: Execute next code)

Dynamic Root of Trust for Measurement

(Intel Trusted Execution Technology)

- Untrusted Code
- D-CRTM (DCE)
- tboot (DLME)
- Bootloader
- Kernel
- User Applications
- TPM

- DL Event

DL Event: Dynamic Launch Event
DCE: DRTM Configuration Environment
DLME: Dynamically Launched Measured Environment
PCRs contains measurement results of a system

They **MUST NOT** be reset by disallowed operations

- Static PCRs (PCR #0~#15) can be reset only if the host resets
- Dynamic PCRs (PCR #17~#19) can be reset only if the host initializes the DRTM

If PCRs are reset by attackers, they can reproduce specific PCR values by replaying hashes

- They can steal the secret and deceive the local and remote verification

[Han’18]
PCR protection mechanisms work properly until yesterday.
Assumptions and Threat Model

• The system measures boot components using the SRTM and DRTM
  • The measurement results stored in PCRs are verified by a remote verifier
  • The modifications of boot components are detected
• The attackers already gain a root privilege and try to compromise the whole system
  • They try to hide the breach and retain the root privilege
  • They cannot access the system circuit physically
  • They cannot flash the firmware with arbitrary code
Advanced Configuration and Power Interface (ACPI)

- Defines power states and hardware register sets
  - Global states
    - G0 (Working), G1 (Sleeping), G2 (Soft-off), G3 (Mechanical-off)
  - Sleeping states
    - S0: Working
    - S1: Power on Suspend (CPU cache flushed, CPU stops execution)
    - S2: Same as S1, CPU is powered off
    - S3: Sleep, All devices are powered off except RAM
    - S4: Hibernation, All devices are powered off
ACPI Sleep Process with TPM

1. Request to save a state
2. Request to enter sleep
3. Sleep (S3, S4)
4. Wake up
5. Request to restore a state
6. Resume OS
The Grey Area vulnerability (CVE-2018-6622)
The Grey Area Vulnerability (CVE-2018-6622)

What is the “corrective action”?

If the TPM receives Startup(STATE) that was not preceded by Shutdown(STATE), then there is no state to restore and the TPM will return TPM_RC_VALUE. The CRTM is expected to take corrective action to prevent malicious software from manipulating the PCR values such that they would misrepresent the state of the platform. The CRTM would abort the Startup(State) and restart with Startup(CLEAR).

This means “reset the TPM”

The startup behavior defined by this specification is different than TPM 1.2 with respect to Startup(STATE). A TPM 1.2 device will enter Failure Mode if no state is available when the TPM receives Startup(STATE). This is not the case in this specification. It is up to the CRTM to take corrective action if it the TPM returns TPM_RC_VALUE in response to Startup(STATE).

Trusted Platform Module Library Part1: Architecture
Exploit of the Grey Area Vulnerability

BIOS/UEFI

Compromised Software Stack

Compromised State

Sleep without saving the TPM state

Sleep

Wake up

Compromised Software Stack

Faked State

Leaves normal hashes in event logs

Extract and calculate the normal hashes

Store the normal hashes in RAM

Reset the TPM and replay the normal hashes

</table>
Countermeasures – The Grey Area Vulnerability

- **Disable S3 sleeping state** option in BIOS menu
  - Brutal, but simple and effective
- Revise TPM 2.0 specification to **enter failure mode** if there is no state to restore
- Revise TPM 2.0 specification to **define “corrective action” in detail**
  - A long time to revise and apply to the TPM or BIOS/UEFI firmware, but fundamental solutions
Countermeasures – The Lost Pointer Vulnerability

- **Apply our patch to tboot**
  - https://sourceforge.net/p/tboot/code/ci/521c58e51eb5be105a29983742850e72c44ed80e/
- **Update tboot to the latest version**
Conclusion

• Two vulnerabilities that can subvert the TPM using S3 sleeping state were found
  • The Grey Area Vulnerability: CVE-2018-6622
  • The Lost Pointer Vulnerability: CVE-2017-16837
• Attackers can deceive the local and remote verification with the vulnerabilities
  • They also can unseal the seal secret and steal it
• We have contacted manufacturers and contributed a patch to tboot project to solve the vulnerabilities
